

EDUCATION

University of British Columbia

Masters of Engineering – Electrical and Computer Engineering Department

- Focused on Machine Learning and Software Engineering

University of British Columbia

Bachelors of Applied Science – Electrical and Computer Engineering Department

Completed: April, 2025

Grade: 4.0 GPA

Completed: April, 2024

Grade: 3.5 GPA

WORK EXPERIENCE

NeuroPrior AI, North Vancouver, BC

Software and Firmware Engineer

- Collaborated in a 5-person team to design a medical EEG/ECG wearable device.
- Developed **firmware in C for BLE communication** (advertising, connecting, ADC data transmission).
- Applied **digital signal processing** to transform sensor input into real-time audio playback and FFT visualizations in both Python and MATLAB.
- Built a Python **desktop application** with a **GUI** to automate device connectivity, stream signals, and visualize data.

Apr, 2024 – Sep, 2024

Quadrant Electronics Inc, North Vancouver, BC

Junior Software Engineer

- Designed and prototyped a **VR pilot training program** in Unity with interactive cockpit controls and instrument simulations for fault-scenario training.
- Created an **AR mobile application** to extend training accessibility.
- Gained experience in **3D data** interaction, rendering, and visualization.
- Engineered workflows **independently** from concept to working prototype, showcasing initiative and cross-disciplinary problem solving.

Apr, 2022 – Aug, 2022

Celly Technologies, North Vancouver, BC

Junior Software and Firmware Developer

- Worked in a 4-person team to design a mobile application that monitored sump pump status and provided real-time user alerts.
- Implemented an **Android camera app** using OpenCV for **image and video frame processing**, automating color-based detection and event classification.
- Integrated AWS backend services **to manage user data** and make device status accessible online, ensuring scalable data delivery and reliability.

Apr, 2020 – Aug, 2020

RESEARCH

Investigating the Role of Test Cases in LLM-Based Python and JavaScript Code Translation

- Investigated different **prompt engineering** and **feature engineering** approaches and **iterative post processing techniques** for two-way Python and JavaScript **code translation**. Our improvements increased the LLM translation success rate from **44% to 91%**.
- Tests included **generating synthetic test cases** to translate code with different LLM models including **Gemini-2.0** and **GPT-3.5**.

Vision Transformer Based Chessboard Image Analysis

- Explored the use of **Vision Transformers** for classifying digital chess board pieces for game state extraction.
- Involved extensive **data pre-processing** but was able to significantly **reduce training complexity** and time while maintaining a model **generalizable** to many board styles and colors. For **100% classification accuracy** the training data required was reduced to **500 from 80,000**.

Transformer Based Actor Critic Agent

- Investigated use cases of **transformers in a reinforcement learning** setting. Tests were done using an actor critic model.
- Utilized **OpenAI Gym** to test the model’s performance in different environments including Cart Pole and lunar Lander.
- Transformer model took longer to converge but was more stable. Reduced agent failure rate from **0.02% to 0.0%**.

Hybrid Physics-Informed Neural Networks and Diffusion Models for Option Pricing

- Developed a hybrid model integrating **Diffusion Models** for stock path prediction and **Physics-Informed Neural Networks** (PINN) for option price prediction. Improved accuracy by **4%** compared to Heston’s model and by **80%** compared to Black-Scholes.
